

Your questions answered

Q: Why do I need an internal COVID-19 testing programme?

A COVID-19 outbreak at the workplace could result in a temporary closure of the premises and disruption to your business.

Testing asymptomatic staff regularly can help minimise the risk of the virus spreading in your office, factory, or workshop.

Our COVID-19 screening programme for asymptomatic employees will give your business the confidence that it is operating safely.

If a member of your staff displays COVID-19 symptoms, please refer them to NHS Test and Trace.

Q: How often should I test my staff for the virus?

We would recommend testing your workforce **once per week**.

Q: What should I do if a member of staff tests positive?

You should tell your staff that one of their colleagues has tested positive – without disclosing any personal details, such as names, etc.

The employee concerned must not enter your premises and will have to self-isolate – see our White Paper for further guidance on matters such as Statutory Sick Pay.

We will have to report any positive COVID-19 cases to Public Health England as well.

Q: How is the testing carried out?

One of our collectors will come to your premises and conduct the sampling.

They will use a swab to collect a sample from the throat – it is not very pleasant, but, thankfully, it is quick! Then our collector will bring the samples to the laboratory, where we will carry out the laboratory work and we will interpret the results for you.

By choosing Complement Genomics for your COVID-19 employee testing, you will deal directly with the laboratory – no third-party resellers or hidden fees.

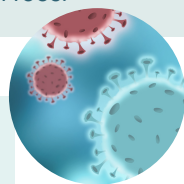

Q: When do I get the results?

We aim to provide results the next working day, however this will be subject to demand.
